

PS | Ship™ introduces PS | Receiver™, an easy-to-use add on module that provides PS | Ship clients with the ability to fully track all inbound and intra-office shipments.

PSIShip automates and simplifies the entire shipping process by linking contact manager data, shipping vendor services and billing systems through a single, unified, web-based interface. And now, with the addition of PSReceiver, PSIShip clients have the ability to track and establish a complete chain-of-custody for all inbound and intra-office shipments.

PS | Receiver – Automating the receiving process in professional service organizations.

PS | Receiver offers everything you need to meet all of your internal shipping and parcel tracking needs. No other solution can save you time and money on every shipment that comes into your office. Adding PS | Receiver to the PS | Ship suite of products truly automates your entire shipping & receiving system. 

The receiver module utilizes established PSIShip technology and workflows, minimizing installation and training time, as well as ongoing system support and maintenance costs.

Every aspect of this system is designed to make use of the current PSIShip environment. This includes hardware, integrated security, employee and operator data, information from previous transactions, and established relationships with existing shipping vendors.

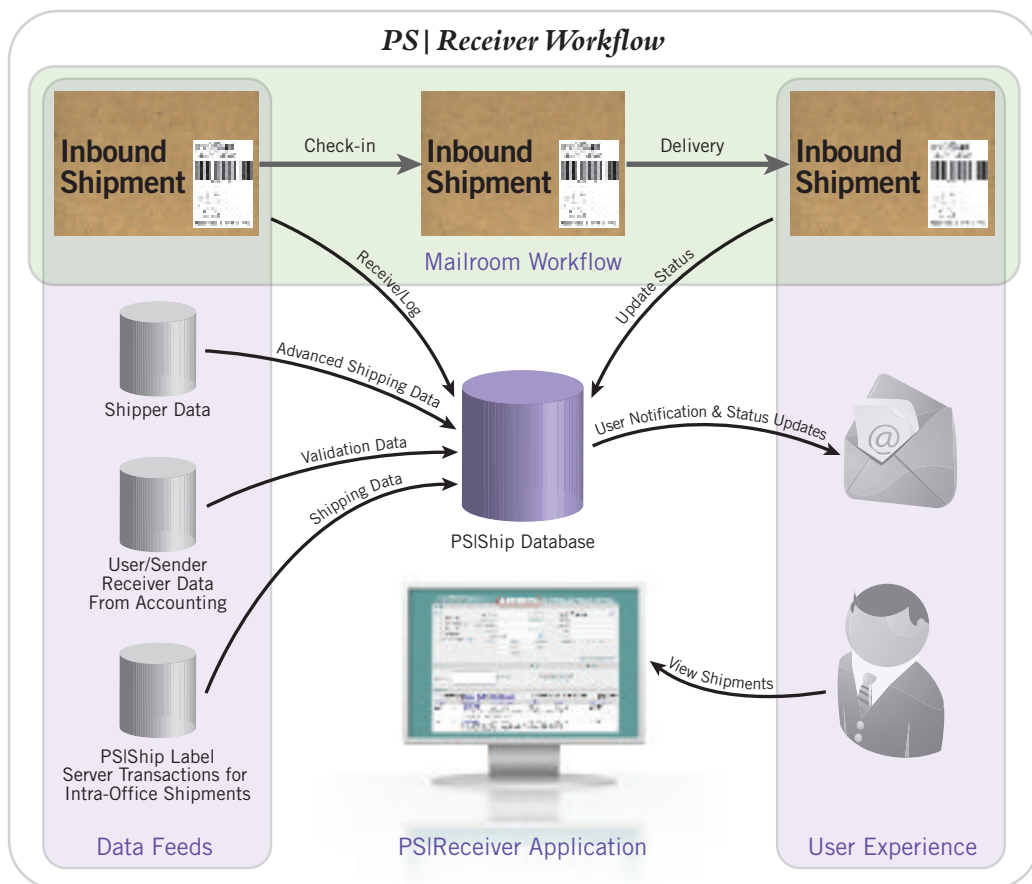

Combined into a single platform, the PSIShip label generation, invoice processing and PSReceiver modules offer a complete solution for all your shipping and parcel tracking needs whether inbound to, or outbound from, your organization.

Key features that make PS| Receiver the complete solution for tracking and handling all inbound packages:

- Shared hardware and security setup with PSIShip Label and Invoice servers eliminates the need to invest in additional equipment and system management.
- Shared data tables with PSIShip Label and Invoice servers, eliminates the need for additional data feeds and data management.
- A common user interface minimizes training and rollout time.
- Intelligent data capture / data recognition dramatically reduces package check-in time and entry errors. (Patent pending.)
- Data capture at each transaction point allows for a complete chain-of-custody and full visibility of the delivery cycle from receiving room to desktop.
- Integration with existing PSIShip “history” allows end-user (receiver) visibility into the status and location of inbound shipments.
- Basic configurations allow for the implementation of PSReceiver using industry standard PDA’s or ini configurations that don’t require additional hardware or scanners.

Inbound Parcel Tracking Has Never Been Easier.

Full accountability and full visibility for everyone involved in the inbound delivery process!
